

Testing Edge Cases ::

Here are 5 edge cases you can mention for your Movie Recommendation Dashboard::

Genre with No Results:

When the user selects a genre that has no movies available from the TMDB API, the app displays a friendly "No movies found" message instead of breaking.

Invalid or Expired API Key:

If the TMDB API key is invalid/expired, the app handles the error gracefully by showing an error message instead of crashing.

Network Failure / API Timeout:

If the API request fails due to poor internet or server issues, the app notifies the user with an error state and allows retry.

Empty Favorites List:

When a logged-in user hasn't saved any movies yet, the "Favorites" section shows a placeholder message instead of rendering a blank UI.

Duplicate Favorites Prevention:

If a user tries to add the same movie multiple times to favorites, the system prevents duplication and shows a proper notification.
